Implantation of Penil Prosthesis (Silicon Model)

Objectives and Goals

The aim of this training is to enhance participants' practical skills in infrapubic and penoscrotal penile prosthesis surgery, and to provide experience in the surgical techniques and topographic anatomy related to possible complications. Through hands-on practice using silicone models, the program aims to enable participants to perform penile prosthesis implantation safely and effectively.

By the end of the training, participants will be able to:

1. Identify different types of penile prostheses (inflatable and malleable),
2. Perform corporal body preparation, and reservoir and pump placement using the infrapubic and penoscrotal techniques on a silicone model with proper surgical methods,
3. Discuss preventive measures and management strategies for potential intraoperative complications (such as perforation, malposition, etc.) and, through hands-on practice, achieve a basic level of surgical competence in penile prosthesis implantation.
